

Amendments to the Specification

On page 10, replace the first full paragraph with the following paragraph:

Major elements of the wireless camera apparatus 110 are shown in block form in Figure 2, as including a digital camera 210, a memory 220, a processor 230, a RF modem 240 which includes an antenna 250, interface means 260, and digital signal processor 266, which in the preferred embodiment are integrated into one unit. However, the wireless camera device 110 and the server 140 may be programmatically implemented by using many general purpose hardware components. For example, the wireless device ~~140~~ 110 may be implemented with a handheld PC such as the Mobilon HC 4100 connected to a CE-AG04 color digital camera card, both available from Sharp Electronics Corporation, and a wireless CDPD modem such as the Sage modem available from Novatel Wireless, Inc. Alternately, the wireless device may be implemented by programming a Novatel Wireless CONTACT handheld PC (which includes an integrated CDPD modem), now available for beta testing from Novatel, and which is connected to any one of several digital cameras presently available on the market. The invention may also be programatically implemented on a combination of notebook computer running the Windows 95 operating system, wireless CDPD modem such as the PM100C CDPD modem from Motorola, and digital camera, such as the QuickCam VC from Connectix Corporation.
